

The Tears AI Will Never Understand

In this era of civilization, one of the greatest changes has taken place in the way we live. One of the most significant developments is AI, or Artificial Intelligence. While AI has made our lives easier in many ways, it has also introduced new challenges. It can help us express our emotions, but excessive dependence on it may also weaken human connections. AI can write a thousand words about love. But it will never know how it feels to wait for someone who may never come back.

A nineteen-year-old girl named Zhuraiba had reached a point in her life where she could not change the past, but she still had a chance to correct her mistakes. She knew that life had brought her to a place where she would have to find her own path forward. She believed that when someone sincerely asks the Creator for something from the heart, he does not turn them away, as long as they keep trying.

She would share problems with AI, but she could not always find the right path. Every day, she thought about her future and every day she cried. Yet her goal was clear, she had to stand on her own feet. She used AI for research every day. Sometimes, when she copied an idea entirely, she received a very good response, but she could not find peace in her heart. It felt like cheating, as if she were deceiving others.

Then she thought that combining her own intelligence and emotions with AI might help her succeed.

Sometimes, memories of her childhood returned and brought her some peace. She remembered the days when AI was not part of their lives, when she and her cousins would visit their grandfather's house during the holidays. Their silly activities often got them into trouble, but they solved their problems together, standing side by side. They played hind-and-seek and kanamachi (a traditional blindfold game), laughing and having fun in a way that words could never fully capture.

Now the world has changed. People no longer come together as they once did or search for solutions together as often as they used to, because AI assistants are always available.

*One day, for some reason, Zhuraiba found herself wondering about something. She asked her AI assistant, **"What is the most difficult task for you?"***

Her AI assistant replied:

"Truly understanding human beings."

I can read what people write, understand the meaning of their words and help them reflect on their experiences. But when someone says, 'I am fine' when suffering deeply inside, I cannot know the depth of their feelings with certainty.

*Zhuraiba began to wonder: **Could someone who had never cried truly understand the meaning of tears?***

After that Zhuraiba understood AI was not her enemy, it was simply a tool. Ultimately, the decisions about her life were hers to make. Her emotions, her faith, her efforts would help toward the right path.

The Creator has blessed human beings with the ability to feel. Emotions help them think, guide their actions and give them courage to stand on their own feet.

"And that is the one thing AI will never understand - that being human is not about being perfect. It is about feeling, falling, and trying again."
